

NavGuard 2007

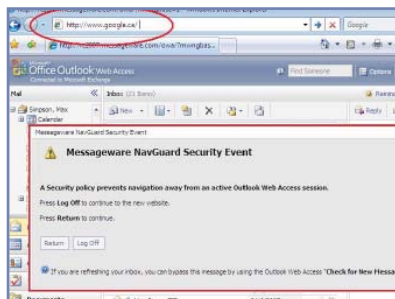

Prevent Unauthorized Access to OWA Accounts

NavGuard 2007 – Outlook Web Access Security for Exchange 2007

NavGuard monitors when an OWA user has created a security vulnerability by navigating away from an active OWA session without logging off. Unauthorized users on shared computers can access this active OWA session without being required to re-authenticate. Even with ISA Server installed, this security vulnerability exists. NavGuard's user-friendly prompt alerts the user when a security event has occurred with the option to logoff before continuing to another page or returning to the active OWA session.

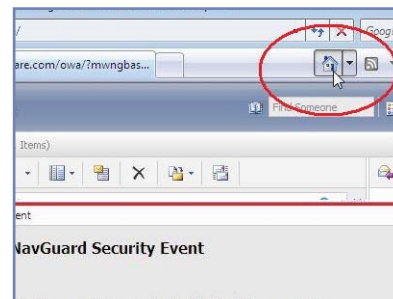

Security Features

Navigation detected when the users enters a new URL in the address bar

NavGuard warning when the user presses the Refresh button
